

1981-2006

At Isofotón, R+D is a strategic axis of growth. With its constant increase in potential, it contributes to generating knowledge, in a way which places this technology at the service of society.

## PRECAUTION 6.8 PRINCIPLE

Isofoton, by the very nature of its activity, has a **commitment to sustainability** and is very sensitive to the criteria for precaution and security. In this sense, the company closely follows all areas of its productive system so that the security of products and processes is guaranteed, from a preventative perspective.

This job is carried out with knowledge of the characteristics of the products that are being researched or developed, attempting to maximize the active measures of a preventative character to avoid potential negative effects on human health or on the environment, and to minimize undesired potential impacts. Therefore, precaution, always balanced, and proportional to risk, is a criteria of application to work developed.

Added to this are the cooperation activities with public and private clients, the communication activities of the nature and characteristic traits of Solar Energy, its generation and distribution procedures, and its relationship with health and the environment.
